

# Starry Sky

Stars are always in the sky, but you can't always see them. Find out why.

At night, the sun sets. The sky gets dark. If there are no clouds, you can see stars. The sky is full of them.

Stars are huge, but they look like tiny dots of light. Stars are far away. That's why they look so small.

During the day, you can see only one star. It's the sun! The sun is close to Earth. It gives off light and heat.

The sun makes the sky so bright that you can't see other stars. After the sun sets, you can see stars again.
